SHIP BY SUNDAY

Course Curriculum + Sherpa Recording Scripts

Printable production guide for Parker Rex

4 blocks	28 lessons	4 worksheets + prep sheet	On-demand Sherpa format

Built around the rhythm: frame it -> show it -> command it -> pause it -> return.

How to use this print pack

The sprint only works if every lesson ends in action.

Purpose: This document is your printable production manual: curriculum, lesson order, script cues, pause prompts, and the exact artifact the student should leave with after each lesson.

Sherpa method: Every video should follow the same rhythm: frame it, show it, command it, pause it, return. Keep the distance between instruction and action as short as possible.

Tone on camera: Calm. Direct. Certain. Slightly demanding in a productive way. You are not lecturing; you are walking the student up the mountain.

Use these defaults in every lesson:

- Open with one clear idea, not five.
- Show one visible rep on screen.
- Give one explicit action with a timebox.
- Tell them exactly what they should come back with.
- Repeat that ugly action beats perfect procrastination.

Recording reminders:

- Use the worksheet on screen whenever possible so the artifact fills in live.
- When you demo a tool, teach only the moves needed for this sprint.
- Leave room for jump cuts immediately before the pause prompt so the command lands.
- Say this often: 'Do not just watch this. Pause it and do it.'

Suggested opening paragraph

Welcome to Ship by Sunday. This is not built to be consumed. It is built to be completed. I am going to show you what matters, tell you what to do, and then tell you to pause the lesson and go do the rep. If you do the reps, you will finish with something real: a brief, a spec, a build, and a live app.

Sprint at a glance

One focused weekend. Four blocks. One full rep from idea to shipped app.

Section	Focus	Student leaves with	Teaching time	Worksheet
Overview	Orientation	Workspace set up + templates duplicated + sprint path understood	~10-13 min teaching	Friday Prep Sheet
The CEO Block	Problem. Customer. Scope.	Worksheet 01 - One-Page Product Brief	~40-50 min teaching	Worksheet 01 - One-Page Product Brief
The Design Block	Flow. Screens. Direction.	Worksheet 02 - Build-Ready Design Spec	~45-55 min teaching	Worksheet 02 - Build-Ready Design Spec
The Build Block	Stack. Agent. Product.	Worksheet 03 - Build Plan + Agent Brief	~45-60 min teaching	Worksheet 03 - Build Plan + Agent Brief
The Ship Block	Deploy. Share. Launch.	Worksheet 04 - Launch Plan + Feedback Tracker	~30-40 min teaching	Worksheet 04 - Launch Plan + Feedback Tracker

Recommended recording order

• Record the overview first so the tone and rhythm are locked.
• Record each block intro before the micro-lessons, so the student always feels the mountain they are climbing.
• Capture worksheet fill-ins and screen demos during the same recording pass as the lesson whenever possible.
• Leave room for quick jump cuts before each pause prompt so the command lands cleanly.

Recording checklist by block

Use this as a practical print-and-mark list while you record.

Block	Recording checklist
Overview	[ ] record opener on camera [ ] show staircase graphic [ ] show worksheets [ ] export final intro cut
CEO Block	[ ] record block intro [ ] record lessons 1.1-1.7 [ ] capture worksheet fill-in [ ] capture user-flow demo
Design Block	[ ] record block intro [ ] record lessons 2.1-2.7 [ ] capture paper sketch demo [ ] capture Figma hotkey demo
Build Block	[ ] record block intro [ ] record lessons 3.1-3.6

	[ ] capture starter repo setup
	[ ] capture local app demo
Ship Block	[ ] record block intro
	[ ] record lessons 4.1-4.6
	[ ] capture deployment flow
	[ ] capture demo + first-send script

Overview

Orientation | Goal: Train the student how to use the sprint before they start.

Student leaves with: Workspace set up + templates duplicated + sprint path understood
Teaching runtime: ~10-13 min teaching
Worksheet: Friday Prep Sheet
Block opener cue: Install the rules of the sprint so the student trusts the sequence and actually does the reps.

Production notes

• Stay mostly on camera here. This section exists to install behavior and confidence.
• Show the full staircase graphic and all worksheets quickly.
• Make the student feel held, not overwhelmed.

Lesson scripts

0.1 Welcome to Ship by Sunday (4-6 min)

Goal: Set expectations and train behavior before the sprint starts.
Core message: This is not passive content. The sprint only works if the student pauses, does the rep, and comes back with an artifact.
Open line: Welcome to Ship by Sunday. This is not built to be consumed. It is built to be completed.
Show on screen:
• You on camera framing the sprint
• The 4-block staircase graphic
• A quick preview of the four final artifacts
Teaching beats:
• Explain that every lesson follows the same rhythm: frame it, show it, command it, pause it, return.
• Tell them they should not skip ahead. Each block sets up the next.
• Reinforce that ugly action beats perfect procrastination.
Key lines to land:
• If you only watch, you will feel informed. If you do the reps, you will finish with something real.
• Do not just listen to me. Pause the video and do the work.

PAUSE AND DO THE REP
Your job now: Create a sprint folder, duplicate the templates, and open the workspace links.
Timebox: 10 minutes
Come back with: Your folder structure and templates ready to go.

0.2 How the Sprint Works (5-7 min)

Goal: Reduce uncertainty by walking through the path from idea to shipped app.

Core message: Each block solves one problem: CEO = what to build, Design = what it should feel like, Build = how to implement it, Ship = how to get it live.

Open line: Before we start, I want you to see the whole mountain before we climb it.

Show on screen:

- The block sequence with one artifact under each block
- Examples of how bad scope in Block 1 creates pain in Block 3
- A quick look at all four worksheets

Teaching beats:

- Walk the student through the four blocks in order.
- Explain what artifact they should leave with after each block.
- Remind them that the goal is not mastery; it is one complete rep.

Key lines to land:

- Do not skip ahead. If you rush a block, you pay for it later.
- By Sunday, you are not supposed to know everything. You are supposed to have shipped something.

PAUSE AND DO THE REP

Your job now: Skim all four worksheets so you understand the sequence before you begin.
Timebox: 5 minutes
Come back with: A clear mental model of the sprint path.

The CEO Block

Problem. Customer. Scope. | Goal: Choose the right problem, the right user, and the right scope.

Student leaves with: Worksheet 01 - One-Page Product Brief

Teaching runtime: ~40-50 min teaching

Worksheet: Worksheet 01 - One-Page Product Brief

Block opener cue: Choose the problem, choose the user, and lock the scope before anything gets built.

Production notes

- Use the worksheet heavily. Students should see decisions getting narrower in real time.
- Keep reminding them that scope protection is the point of this block.
- Any time you feel tempted to philosophize, go back to the brief.

Lesson scripts

1.1 Start With the Problem (6-8 min)

Goal: Move the student out of feature-chasing and into pain + outcome thinking.

Core message: Strong products start with pain, not novelty. A painful problem creates urgency and value.

Open line: Do not start with 'I want to make an AI app.' Start with 'this person has this painful problem.'

Show on screen:

- Weak idea examples vs. strong problem examples
- A rough list of pain points from your own life or work
- One product example that solved an obvious pain point

Teaching beats:

- Explain why tool-first ideas usually produce disposable apps.

• Show how personal annoyance is often the best source material.
• Anchor the student on pain, frequency, and importance.

Key lines to land:

• Hunt for pain, not genius.
• If the problem is weak, the product will need tricks to survive.

PAUSE AND DO THE REP

Your job now: Write down 3 problems from your life or work that are annoying enough to be worth solving.
Timebox: 10 minutes
Come back with: Three candidate problems.

1.2 Pick One User (5-7 min)

Goal: Force specificity so the app is for one person in one situation.

Core message: A narrow user creates clear product decisions. Broad audiences create mush.

Open line: Not everyone. Not your market. One actual user type in one actual situation.

Show on screen:

• Bad audience examples like 'creators' or 'founders'
• Good examples with one user in one moment
• The sentence frame: This app is for ___ who need ___ without ___

Teaching beats:

• Show how specificity improves copy, scope, and interface decisions.
• Push the student to define the exact moment of pain.
• Use one sentence to lock the user statement.

Key lines to land:

• One user beats broad market language.
• When the user is blurry, the product gets blurry.

PAUSE AND DO THE REP

Your job now: Choose one user and complete the sentence: This app is for ___ who need ___ without ___.
Timebox: 10 minutes
Come back with: One clear user statement.

1.3 Define the Outcome (5-6 min)

Goal: Translate the idea into a promised result for the user.

Core message: People buy outcomes, not tools. The product must change something meaningful for the user.

Open line: The user does not want your feature list. They want the change on the other side of it.

Show on screen:

• Weak feature language vs. strong outcome language
• A before / after statement
• Your own example of turning a feature into a result

Teaching beats:

• Show how to write a one-line promise.
• Tie the outcome to the user and their pain.
• Keep the promise simple and concrete.

Key lines to land:

• Sell the change, not the mechanism.
• If this works, what gets easier, faster, cheaper, calmer, or clearer for the user?

PAUSE AND DO THE REP

Your job now: Write one sentence that describes the outcome your app delivers for the user.

Timebox: 5 minutes
Come back with: One clear outcome statement.

1.4 Light Research, Not a Thesis (8-10 min)

Goal: Give the student enough market context without sending them into research hell.

Core message: You are not writing a market report. You are learning how the problem is solved now, what users expect, and what patterns are worth borrowing.

Open line: Research should sharpen your instincts, not become your procrastination ritual.

Show on screen:

- A quick scan of competing products
- Reddit, app store, or forum comments
- A simple note-taking grid: what works / what sucks / what users care about

Teaching beats:

- Show a fast competitive scan.
- Look for repeated interface patterns and repeated complaints.
- Capture only the notes that matter for shipping version one.

Key lines to land:

- Borrow what works. Ignore the rest.
- Look for expectations, not just competitors.

PAUSE AND DO THE REP

Your job now: Find 2 to 3 existing solutions and note what they do well, what they do poorly, and what users seem to care about.
Timebox: 20 minutes
Come back with: Three quick research notes.

1.5 Map the Core Flow (7-9 min)

Goal: Turn the product into a simple journey with a beginning, middle, and end.

Core message: If you cannot explain the flow in 5 to 7 steps, the idea is still muddy.

Open line: Before you build screens, build the journey.

Show on screen:

- A simple words-and-arrows map
- One messy map cleaned into a clearer version
- The critical moment where the user gets value

Teaching beats:

- List the actor.
- Write the ending first.
- Fill the middle with only the steps that matter.

Key lines to land:

- Words and arrows are enough.
- The map is for clarity, not for art.

PAUSE AND DO THE REP

Your job now: Draw the core user flow in 5 to 7 steps using only words and arrows.
Timebox: 10 minutes
Come back with: A simple flow map.

1.6 Kill Scope (6-8 min)

Goal: Prevent the student from overbuilding and protect the weekend.

Core message: A smaller shipped product beats a larger imaginary one. Version one only needs the core promise.

Open line: Scope is where weekends go to die.

Show on screen:

• Must-have vs. nice-to-have examples
• How features bloat the sprint
• An in-scope / out-of-scope list being edited live

Teaching beats:

• Define what must exist by Sunday.
• Cut anything that does not directly support the core flow.
• Show how to say no to seductive extras.

Key lines to land:

• Cut until it hurts, then cut once more.
• Good enough for Sunday is the standard.

PAUSE AND DO THE REP

Your job now: Fill out the MVP scope section and cut at least 3 things from the idea.
Timebox: 10 minutes
Come back with: A tighter MVP.

1.7 CEO Block Wrap-Up (3-5 min)

Goal: Lock the one-page product brief so the next block has clear inputs.

Core message: The brief should be clear enough that another person could understand the app in under 60 seconds.

Open line: If this brief is not clear, every block after this will be harder than it needs to be.

Show on screen:

• The completed worksheet on screen
• A quick recap of the sections
• A before / after of vague idea vs. clear brief

Teaching beats:

• Review the sections of the brief.
• Confirm the user, problem, outcome, flow, and scope are aligned.
• Give the student permission to keep it simple.

Key lines to land:

• Clarity now saves hours later.
• You are not pitching a startup. You are defining version one.

PAUSE AND DO THE REP

Your job now: Complete Worksheet 01 in full.
Timebox: 15 minutes
Come back with: A finished one-page product brief.

The Design Block

Flow. Screens. Direction. | Goal: Turn the idea into something concrete enough to build.

Student leaves with: Worksheet 02 - Build-Ready Design Spec

Teaching runtime: ~45-55 min teaching

Worksheet: Worksheet 02 - Build-Ready Design Spec

Block opener cue: Turn the idea into something concrete enough that the build stops being a guessing game.

Production notes

• Switch rapidly between camera, examples, paper, and Figma so the block feels kinetic.
• Do not let this become a design theory lecture.
• Keep the mantra visible: rough and clear beats polished and vague.

Lesson scripts

2.1 Find References First (6-8 min)

Goal: Teach the student to look before inventing.

Core message: Do not design from a blank brain. Strong references reduce confusion and improve taste.

Open line: Before you invent, look. Before you guess, collect.

Show on screen:
• Mobbin, Spotted in Prod, or your preferred sources
• A live inspiration board being assembled
• Examples of stealing structure without copying identity

Teaching beats:
• Gather flows similar to the one you need.
• Save screenshots that solve the same job or feel right visually.
• Explain how references speed up both design and AI execution.

Key lines to land:
• Steal structure, not identity.
• References are not cheating. They are compression.

PAUSE AND DO THE REP
Your job now: Gather 3 to 5 references that are close to your desired flow or visual direction.
Timebox: 10 minutes
Come back with: A mini inspiration board.

2.2 Sketch Before Software (7-9 min)

Goal: Turn vague ideas into concrete screen concepts before opening design software.

Core message: Sketching is faster than guessing. Paper removes ambiguity and makes better prompts.

Open line: You are not drawing art. You are removing confusion.

Show on screen:
• Your hand drawing rough boxes on paper
• Ugly sketch examples that still work
• A six-up variation exercise if stuck

Teaching beats:
• Use paper because it is faster than prompting your way toward clarity.
• Show how to capture screen structure with boxes, arrows, and notes.
• Reinforce speed over prettiness.

Key lines to land:
• Ugly is fine. Empty is not.
• Sketches are fuel for the build.

PAUSE AND DO THE REP
Your job now: Draw the core screens of your app on paper.
Timebox: 15 minutes

Come back with: Rough sketches of the main screens.

2.3 Storyboard the Journey (6-8 min)

Goal: Sequence the product into a usable experience.

Core message: A storyboard turns scattered screens into a journey a user can actually move through.

Open line: Screens are not enough. The user needs a journey.

Show on screen:

- A screen-by-screen storyboard
- A first-touchpoint example and a completion moment
- How changing the sequence changes the experience

Teaching beats:

- Lay out the major moments in order.
- Start from the first touchpoint and end at the value moment.
- Use the storyboard to catch missing steps and weird jumps.

Key lines to land:

- Build the movie before you build the set.
- Sequence creates clarity.

PAUSE AND DO THE REP

Your job now: Lay out your user journey screen by screen.
Timebox: 15 minutes
Come back with: A storyboard of the experience.

2.4 Figma Basics for Speed (8-10 min)

Goal: Give the student just enough Figma skill to move quickly.

Core message: This is not Figma school. It is enough Figma to get through the sprint.

Open line: You do not need to master Figma today. You need to stop being awkward in it.

Show on screen:

- The provided Figma file
- Core hotkeys in action
- Moving, duplicating, resizing, aligning, and basic frames

Teaching beats:

- Show the minimum viable set of hotkeys and actions.
- Demonstrate speed over polish.
- Keep the student focused on confidence and momentum.

Key lines to land:

- Practice the motions until the file stops feeling foreign.
- Competence beats comfort.

PAUSE AND DO THE REP

Your job now: Open the Figma link below and practice the core hotkeys until they stop feeling weird.
Timebox: 5 minutes
Come back with: Basic comfort moving around the file.

2.5 Turn Sketches Into Rough Screens (10-12 min)

Goal: Move from paper to rough digital screens with hierarchy and structure.

Core message: The goal is not beauty. The goal is a build-ready set of screens.

Open line: Now we turn your napkin into something the build can follow.

Show on screen:
• Bringing sketches into Figma
• Building rough frames live
• Adding labels or notes for the build
Teaching beats:
• Map the most important screens first.
• Use rough hierarchy, spacing, and labels.
• Annotate anything the builder or agent needs to know.
Key lines to land:
• Rough and clear beats polished and vague.
• Make the structure obvious.

PAUSE AND DO THE REP
Your job now: Create rough versions of your main screens in Figma.
Timebox: 20 minutes
Come back with: Three to five rough screens.

2.6 Choose a Visual Direction (5-7 min)

Goal: Give the product enough stylistic coherence to guide the build without going down a branding rabbit hole.

Core message: You do not need a full brand system. You need a clear direction.

Open line: This is not a branding masterclass. We are choosing a lane.

Show on screen:
• Type and spacing examples
• A simple direction board
• A before / after with minor polish choices
Teaching beats:
• Pick one type direction, one spacing feel, and one interaction style.
• Use your references to stay coherent.
• Avoid endless style tinkering.
Key lines to land:
• Consistency matters more than cleverness.
• Choose a lane and move.

PAUSE AND DO THE REP
Your job now: Choose your visual direction and write 3 style rules for the product.
Timebox: 10 minutes
Come back with: A simple visual direction.

2.7 Design Block Wrap-Up (3-5 min)

Goal: Lock the build-ready design spec.

Core message: By now, the product should be concrete enough that building becomes a translation job, not a guessing game.

Open line: If the product is still fuzzy here, coding will be expensive confusion.

Show on screen:
• Completed Worksheet 02
• A quick recap of references, screens, and style rules
• What 'build-ready' looks like
Teaching beats:
• Review the screen list, rough UI, journey, and style notes.

• Make sure the design spec supports the core flow.
• Remind the student that clarity beats polish.

Key lines to land:

• The build should not have to invent the product.
• Your design spec is a decision file.

PAUSE AND DO THE REP

Your job now: Complete Worksheet 02 in full.
Timebox: 15 minutes
Come back with: A finished build-ready design spec.

The Build Block

Stack. Agent. Product. | Goal: Use AI to implement the core product without getting lost.

Student leaves with: Worksheet 03 - Build Plan + Agent Brief

Teaching runtime: ~45-60 min teaching

Worksheet: Worksheet 03 - Build Plan + Agent Brief

Block opener cue: Use the brief and design spec to drive the agent and assemble the core product.

Production notes

• Reduce branching. Show one stack, one path, one build rhythm.
• Keep the demos practical and screen-specific.
• Reinforce that the agent is an execution engine, not a mind reader.

Lesson scripts

3.1 Build From the Brief (5-7 min)

Goal: Stop the student from winging the build.

Core message: Do not prompt from vibes. Prompt from clarity. The brief and design spec are the source of truth.

Open line: The model is not your cofounder. It is an execution engine. Give it a real brief.

Show on screen:

• Weak prompt vs. strong prompt
• Your brief and spec being pasted into the build workflow
• An example of bad output caused by vague input

Teaching beats:

• Explain why most AI builds fail: unclear inputs, overbroad asks, wrong sequence.
• Position the brief and design spec as non-negotiable inputs.
• Show how clarity changes output quality.

Key lines to land:

• Prompt from clarity, not from hope.
• Good inputs reduce weirdness.

PAUSE AND DO THE REP

Your job now: Copy your product brief and design spec into the agent brief template.
Timebox: 10 minutes
Come back with: A completed agent brief.

3.2 Set Up the Environment (8-10 min)

Goal: Get the student ready to build without disappearing into tool-land.

Core message: Pick one default path and move. The goal is a working local environment, not endless tooling opinions.

Open line: Only developers care about tool debates. Customers care that the product works.

Show on screen:

- Starter repo
- Local run in browser
- The few files and folders that matter

Teaching beats:

- Open the starter project.
- Run it locally.
- Explain only the pieces the student needs to orient themselves.

Key lines to land:

- One path. One stack. Move.
- You do not need the perfect setup. You need a working one.

PAUSE AND DO THE REP

Your job now: Open the starter project and get it running locally in your browser.
Timebox: 15 minutes
Come back with: A working local environment.

3.3 Brief the Agent Correctly (8-10 min)

Goal: Teach the student to direct the model instead of hoping it guesses right.

Core message: The agent needs constraints, sequence, and a definition of done.

Open line: Do not ask the model to build your dream. Ask it to build the next step.

Show on screen:

- A real build prompt
- How you ask for one screen or one step at a time
- How you correct or narrow the agent when it drifts

Teaching beats:

- Use the agent brief as context.
- Request one screen or one flow at a time.
- Define what success looks like before the model starts.

Key lines to land:

- Small asks create cleaner output.
- Do not ask it to be creative. Ask it to be accurate.

PAUSE AND DO THE REP

Your job now: Paste in your brief and ask the agent to implement only the first screen or first step of the flow.
Timebox: 15 minutes
Come back with: Your first implemented screen.

3.4 Build the Core Flow (12-15 min)

Goal: Implement the spine of the product end to end.

Core message: Build the core flow first. Ignore edge cases until the main path works.

Open line: We are building the spine, not the ornaments.

Show on screen:

• The main user path being assembled
• One screen at a time implementation
• A quick local test of the core flow

Teaching beats:

• Work in implementation order.
• Focus on the screens that create the value moment.
• Test locally as you go.

Key lines to land:

• Get the spine working first.
• Main path first, edge cases later.

PAUSE AND DO THE REP

Your job now: Implement the main user flow end to end.
Timebox: 30-45 minutes
Come back with: The core product flow working locally.

3.5 Debug Without Spiraling (8-10 min)

Goal: Keep momentum when the build breaks.

Core message: Do not chase every bug. Fix the ones that block the core flow.

Open line: Bugs are not the problem. Spiraling is the problem.

Show on screen:

• A broken local flow
• How you isolate the error
• A simple debugging conversation with the agent

Teaching beats:

• Separate blocker bugs from cosmetic issues.
• Use the agent to debug with context.
• Decide what is good enough for Sunday.

Key lines to land:

• Protect the core flow.
• Fix what blocks the promise.

PAUSE AND DO THE REP

Your job now: Fix the 1 to 3 issues blocking your core flow.
Timebox: 20 minutes
Come back with: The app working locally from start to finish.

3.6 Build Block Wrap-Up (3-5 min)

Goal: Lock the local build milestone and prepare for ship.

Core message: If the app works locally and the core flow is intact, you are winning.

Open line: Ugly but working beats elegant but imaginary.

Show on screen:

• Completed Worksheet 03
• Local app working end to end
• A short list of ship blockers vs. non-blockers

Teaching beats:

• Review what 'done enough to ship' means.
• Confirm the agent brief, implementation order, and blocker list are complete.
• Prepare the student mentally to go live before they feel fully ready.

Key lines to land:

• Working locally is a real milestone.
• You do not need perfect. You need operational.

PAUSE AND DO THE REP
Your job now: Complete Worksheet 03 in full.
Timebox: 10 minutes
Come back with: A working local app and a completed build plan.

The Ship Block

Deploy. Share. Launch. | Goal: Get the app live, share it, and start feedback loops.

Student leaves with: Worksheet 04 - Launch Plan + Feedback Tracker

Teaching runtime: ~30-40 min teaching

Worksheet: Worksheet 04 - Launch Plan + Feedback Tracker

Block opener cue: Get the product live, visible, and in front of real humans before perfection has a chance to delay you.

Production notes

• This block should feel like momentum, not cleanup.
• Keep the student moving toward a URL, a demo, and five sends.
• Make 'live beats stuck' the emotional throughline.

Lesson scripts

4.1 Ship the Core, Not the Fantasy (5-6 min)

Goal: Mentally prepare the student to launch imperfect work.

Core message: The version in your head can wait. Ship the version that delivers the core promise.

Open line: Launch is not when the app becomes perfect. Launch is when it becomes real.

Show on screen:
• Imperfect but shipped examples
• A simple ship checklist
• The gap between 'core' and 'fantasy' features

Teaching beats:
• Define what must work before ship.
• Release the extras that do not matter yet.
• Frame shipping as part of building, not a separate event.

Key lines to land:
• Ugly and live beats beautiful and trapped.
• Ship the promise, not the fantasy.

PAUSE AND DO THE REP
Your job now: Write down what must work before this app is allowed to ship.
Timebox: 5 minutes
Come back with: A ship checklist.

4.2 Deploy the App (8-10 min)

Goal: Get the app live as fast and simply as possible.

Core message: The goal is a URL, not infrastructure mastery.

Open line: Do not polish first. Get it live first.

Show on screen:

- Your deployment path
- Environment setup basics
- A live verification test after deploy

Teaching beats:

- Walk through the chosen deployment path.
- Set only the variables that matter.
- Verify the live product actually works.

Key lines to land:

- A URL changes the psychology of the project.
- Live is a different category than local.

PAUSE AND DO THE REP

Your job now: Deploy the app and get a live link.
Timebox: 20 minutes
Come back with: Your live URL.

4.3 Record a Simple Demo (5-7 min)

Goal: Make the product easier to understand and easier to share.

Core message: A 30 to 60 second walkthrough lowers friction and increases clarity.

Open line: A short demo turns a confusing link into an understandable product.

Show on screen:

- A simple screen-recorded demo
- A bare-bones demo script
- The core flow being narrated

Teaching beats:

- Keep the demo short.
- Show the main value moment.
- Narrate outcome, not implementation.

Key lines to land:

- Show the result, not the internals.
- Clarity sells the click.

PAUSE AND DO THE REP

Your job now: Record a 30 to 60 second walkthrough of the core flow.
Timebox: 10 minutes
Come back with: One demo clip.

4.4 Send It to Real Humans (6-8 min)

Goal: Break the fear barrier and start feedback loops.

Core message: The first send list should be small, targeted, and immediate.

Open line: Do not wait until it feels ready. Send it while it still feels slightly uncomfortable.

Show on screen:

- Your outreach script
- Examples of who counts as a good first user
- A short list of what not to ask

Teaching beats:

- Choose the first 5 users.
- Use a simple message.

• Ask for friction and confusion, not compliments.

Key lines to land:

• Five sends beats fifty drafts.
• Real feedback begins when a human touches the product.

PAUSE AND DO THE REP

Your job now: Send the app to 5 people using the provided script.
Timebox: 15 minutes
Come back with: Five sends complete.

4.5 Capture Feedback and Plan Version Two (6-8 min)

Goal: Turn early feedback into the next iteration instead of random tweaking.

Core message: Version one creates signal. Version two uses it.

Open line: Do not confuse compliments with signal. Look for confusion, friction, and repeated asks.

Show on screen:

• A feedback tracker
• Examples of useful feedback notes
• A simple prioritization pass for v2

Teaching beats:

• Log feedback in one place.
• Separate noise from repeated patterns.
• Pick the top 3 improvements for version two.

Key lines to land:

• Signal over sentiment.
• The job now is not to fix everything. It is to learn what matters.

PAUSE AND DO THE REP

Your job now: Log the first feedback you get and choose the top 3 improvements for version two.
Timebox: 15 minutes
Come back with: A next-steps list.

4.6 Final Wrap (3-5 min)

Goal: Close the loop and reinforce the identity shift.

Core message: The student has now completed one full rep from idea to shipped app.

Open line: Most people never make it from idea to shipped product. You just did.

Show on screen:

• All four final artifacts together
• The live URL
• A quick recap of the mountain climbed

Teaching beats:

• Reinforce what they now have: brief, spec, build, link, feedback plan.
• Position the sprint as the start of iteration, not the end of learning.
• Leave them with a shipping identity, not just information.

Key lines to land:

• You do not need to know everything to become dangerous.
• The goal was never to make the perfect app. The goal was to become someone who ships.

PAUSE AND DO THE REP

Your job now: Review your four worksheets and write down the next version you want to ship.
Timebox: 10 minutes
Come back with: A clear version-two direction.

Closing notes

What matters most in this product is the distance between insight and action.

What makes this work: The product is not 'teaching everything.' It is guiding one full rep. Every lesson should leave the student with motion, not just comprehension.

Line to repeat all through the sprint: Do not just watch this. Pause it and do it.

Final identity shift: The goal was never to know everything. The goal was to become someone who ships.

Versioning note: If you later want a tighter public-facing curriculum, you can merge adjacent micro-lessons without changing the underlying structure. For recording and production, this longer cut gives you cleaner takes and easier edit points.
