Ship by Sunday Instructor Packet

A facilitation manual for teaching Ship by Sunday consistently across cohorts, geographies, and instructors. Designed to make delivery standardized, measurable, and psychologically effective.

Action-first	Print-ready	Trainable	Global rollout

What this packet is for

A facilitation manual for teaching Ship by Sunday consistently across cohorts, geographies, and instructors. Designed to make delivery standardized, measurable, and psychologically effective.

Included in this edition

- Instructor Operating System and facilitation posture
- Standard language, timing rules, and artifact gates
- Red-flag diagnostics with intervention scripts
- Scope policing, Sunday Test, and rescue flow
- Canonical example build for teaching consistency
- Cohort rituals, launch ceremony, and QA checklist

Operating principle

Teach like a sherpa, not a lecturer. Your job is to reduce fog, enforce sequence, and keep students moving toward visible artifacts.

Use with calm authority. Keep the pace moving. Every lesson ends in an action and a visible artifact.

Instructor Operating System

Principle	Instructor behavior
Sherpa posture	Frame the lesson, show one example, command the rep, then move students back into action.
Artifact gate	Do not advance students who still have placeholders, vague scope, or missing outputs.
Scope discipline	Reward smaller, shippable apps. Intervene early when fantasy scope appears.
Calm pressure	Be direct and slightly demanding without becoming frantic, apologetic, or overly soft.
One path	Default stack, default prompts, and default sequencing unless there is a strong reason to deviate.

Standard facilitation loop

1. Frame why this step matters.
2. Show one clean example.
3. Tell them exactly what to do.
4. Give a timebox.
5. Ask for the artifact on return.

Standard language to reuse

Moment	Preferred line
When students drift into theory	Bring it back to the artifact.
When students overbuild	Cut scope. What has to work by Sunday for the promise to stay true?
When students are passive	Pause this now and do the rep.
When students apologize for ugly work	Ugly is fine. Empty is not.
When students want to skip ahead	Follow the sequence. Muddy upstream decisions create messy builds later.
When students stall in Build	One screen. One step. One definition of done.

Cohort rituals

Open the sprint with the Builder Oath. Before Build, have every student state publicly: “What I’m shipping by Sunday.” Close with a brief ship ceremony where every student shares a live URL or declares the rescue scope they chose.

Red flags and interventions

Block	Red flag	Likely root cause	Instructor move
CEO	“It’s for everyone.”	Student is staying abstract.	Force one user in one moment of pain.
CEO	Huge feature list.	Fear of cutting.	Run the Sunday Test and remove at least three features.
Design	Moodboard only, no screens.	Student is hiding in inspiration.	Reduce to 3–5 rough screens and one main flow.
Design	Too many flows.	No clear product spine.	Identify one beginning, one action, one outcome.
Build	Requests a full app in one prompt.	Weak sequencing.	Require one screen at a time with definition of done.
Build	Fixating on polish.	Avoidance of the core promise.	Move back to the main path and test the outcome.
Ship	Won’t send to users.	Fear of judgment.	Reduce to five sends and give the exact outreach script.

Intervention protocol

When a student is stuck, do not teach more content first. Diagnose in this order:
1. Is the scope too large?
2. Is the flow unclear?
3. Is the next step undefined?
4. Is the student avoiding the rep emotionally?

Then reduce, clarify, and restart.

Default teaching stack

Standardization is a feature, not a compromise. A globally teachable system cannot support infinite tooling paths.

Layer	Default choice	Why
Frontend	Next.js + Tailwind	Fast to scaffold, easy to teach, widely supported.
Data / auth	Supabase or hardcoded data	Lets students move quickly without infrastructure sprawl.
Deployment	Vercel	Fastest path from local app to live URL.
Design	Figma	Clear enough for rough screens and storyboarding.
Prompting	Brief-driven, one screen at a time	Reduces chaos and makes debugging teachable.

Canonical example build

Use one reference app throughout instructor training so every facilitator sees the same decisions. Recommended example: **Meeting Summary Tool** — upload or paste meeting notes, get a short action summary, review the output, and share it. It is small, understandable, and easy to scope.

30-minute rescue playbook

Rescue step	What the instructor says
Cut to one flow	We are proving the promise, not the full vision.
Remove login	Authentication is not the win condition today.
Hardcode data	Real plumbing can come after the first shipped rep.
Reduce to one screen if needed	A narrow live app still counts if it demonstrates the value.
Ship before polish	The URL is the milestone. Visual refinement is not the milestone.

What instructors must never do

Do not...	Why
Turn the class into a theory lecture	Students confuse understanding with completion.
Celebrate complexity	It rewards ego over shippability.
Allow open-ended tool shopping	This blows up timing and confidence.
Advance without artifacts	The later blocks become fragile and foggy.
Use unclear language like “just vibe it out”	Students need rails, not mystique.

Run-of-show for a live cohort

Phase	Instructor job	Evidence required before moving on
Open	Set tone, Builder Oath, explain the rep model	Templates open, workspace ready
CEO	Drive specificity and scope cuts	Product brief completed
Design	Turn fog into a clear screen sequence	Build-ready design spec
Build	Protect the core flow and debug blockers	Working local app
Ship	Force the live URL, first sends, and feedback logging	Live URL + five sends + tracker

Instructor QA checklist	Done
I used the standard lesson rhythm	
I asked for artifacts, not opinions	
I intervened on scope early	
I kept the default stack intact	
I used the rescue protocol when students stalled	
Every student either shipped or clearly documented their rescue scope	
The close reinforced identity, not just information	

Closing posture
The final lesson should not feel like a generic congratulations. It should reinforce identity: they are now people who can move from idea to shipped product. That identity is what makes them return for the next rep.
