MAN MEETS AI

SHIP BY SUNDAY
Recording Guide

Detailed curriculum + sherpa scripts for recording the full async sprint

Format	On-demand weekend sprint
Use this for	Recording the course, planning screen shares, and keeping each lesson action-first.
Teaching posture	You are the sherpa: frame it, show it, command it, pause it, and bring them back.
Non-negotiable	Do not let the student passively consume. Every lesson should end in an action and a visible artifact.

“This sprint is not designed to be consumed. It is designed to be completed.”

How to use this guide

- Record calm, direct, and slightly demanding. You are not lecturing; you are moving the student forward.
- Every lesson follows the same rhythm: why this matters, what good looks like, one demo, a clear pause prompt, and a close.
- Bias toward examples, live fills, and screen sharing. Keep philosophy short and implementation obvious.
- Use repetition intentionally. Remind them often: pause here, do the rep, come back with the artifact.
- Ugly work is acceptable. Empty work is not. Keep them moving.

Reusable lesson pattern

1. Frame it	Explain why the lesson matters in practical terms.
2. Show it	Do one example on camera or screen share.
3. Command it	Tell them exactly what to do next.
4. Pause it	Give a timebox and say what they must come back with.
5. Lock it in	Summarize what success looks like and send them to the next lesson.

Good lines to reuse

"Do not just watch this. Pause it and do it."

"You are not trying to master everything here. You are trying to finish one full rep."

"Do not be clever. Follow the sequence."

"Ugly and finished beats elegant and imaginary."

"Come back when you have something on the page."

Sprint at a glance

Overview	Orient the student. Set the rules. Preview the artifacts.
CEO Block	Choose the problem, user, outcome, core flow, and Sunday scope.
Design Block	Gather references, sketch, storyboard, and make the product buildable.
Build Block	Set up the project, brief the agent, implement the core flow, and fix what matters.
Ship Block	Deploy, demo, share, gather feedback, and close the rep.

Final student artifacts: One-Page Product Brief, Build-Ready Design Spec, Build Plan + Agent Brief, Launch Plan + Feedback Tracker.

Overview

Teach them how to use the sprint before they start.

Block goal	Set expectations, teach the action-first rhythm, and remove ambiguity about the 4-block path.
Final artifact	Workspace set up + templates duplicated + clear sense of the sequence.
Recording mindset	Keep the pace moving. Explain only what helps the student make the artifact.

0.1 - Welcome to Ship by Sunday

Length	4–6 min
Purpose	Set the rules of engagement and establish your sherpa posture.
What the student should leave with	Your workspace open and your templates ready.

Suggested opening lines

"Welcome to Ship by Sunday. This is not a course you binge in the background. It is a guided sprint, and it only works if you do the reps."

Beats to cover

- Tell them what the sprint is: a structured weekend path from idea to deployed web app.
- Tell them what it is not: not passive content, not a theory course, not a perfection exercise.
- Preview the four artifacts they will create so the finish line feels real.
- Explain that you will often tell them to pause, do the work, and come back.
- Set the emotional tone: calm confidence, no fluff, no overexplaining.

On-screen / screen-share

- Show the four blocks and the four worksheet names.
- Show a quick preview of what a finished brief, design file, local app, and live URL look like.

Watchouts

- Do not ramble through your backstory. Keep the intro sharp and behavior-driving.
- Do not sound apologetic about telling them to pause. That is the product.

Suggested close

"If you do the reps, you will finish with something real. If you just watch, you will not. So set up your folder, duplicate the templates, and let's start properly."

PAUSE AND DO THE REP

Your job now: Create your sprint folder and duplicate the provided templates.

Timebox: 10 minutes

Come back with: Your workspace open and your templates ready.

0.2 - How the Sprint Works

Length	5–7 min
Purpose	Walk them through the 4-block sequence and reduce uncertainty.
What the student should leave with	A clear sense of the sequence.

Suggested opening lines

"Before we touch the first block, I want you to see the whole mountain. Each block solves a different problem, and each one sets up the next."

Beats to cover

- Explain the role of the CEO Block: decide what to build and what to ignore.
- Explain the role of the Design Block: remove ambiguity before code starts.
- Explain the role of the Build Block: translate the brief into a working local app.
- Explain the role of the Ship Block: get the app live and in front of real people.
- Tell them why skipping ahead causes pain later.

On-screen / screen-share

- Use the staircase or roadmap visual and point to the artifact produced at each block.
- Show how a muddy brief leads to messy design and bad prompting.

Watchouts

- Do not let this become abstract systems talk. Keep it tied to practical outcomes.

Suggested close

"Good. You know the path now. Don't overthink the mountain. Just take the first switchback and enter the CEO Block."

PAUSE AND DO THE REP

Your job now: Skim the four worksheets and the module titles so you can see the full path once before starting.

Timebox: 5 minutes

Come back with: A clear sense of the sequence.

The CEO Block

Problem. Customer. Scope.

Block goal	Choose a problem worth solving, define the user and outcome, map the core flow, and cut the idea down to something shippable.
Final artifact	Worksheet 01 - One-Page Product Brief.
Recording mindset	Keep the pace moving. Explain only what helps the student make the artifact.

1.1 - Start With the Problem

Length	6–8 min
Purpose	Get the student out of "cool AI idea" mode and into pain-first thinking.
What the student should leave with	3 candidate problems.

Suggested opening lines

"Most people start with a feature. I want you to start with a problem that is annoying enough that somebody would actually care if it got solved."

Beats to cover

- Contrast weak feature-first ideas with strong pain-first ideas.
- Use one personal example from your own life or work to show where strong ideas come from.
- Explain that boring pain is often better than flashy novelty.
- Give permission to start with ordinary frustration, not genius.

On-screen / screen-share

- Show a notes app with three example problems.
- If helpful, show one weak idea and rewrite it into a stronger problem statement.

Watchouts

- Do not let this turn into a startup philosophy lecture.
- Do not imply they must discover a billion-dollar market right now.

Suggested close

"You do not need the perfect idea. You need a real problem with enough pain to be worth working on this weekend."

PAUSE AND DO THE REP

Your job now: Write down 3 problems from your life or work that are annoying enough to be worth solving.

Timebox: 10 minutes

Come back with: 3 candidate problems.

1.2 - Pick One User

Length	5–7 min
Purpose	Force specificity so the product has a real point of view.
What the student should leave with	One clearly defined user statement.

Suggested opening lines

"If this app is for everyone, it is for no one. We are going to pick one user in one situation and build from there."

Beats to cover

- Explain why broad audiences create muddy decisions.
- Give the sentence stem: This app is for ___ who need ___ without ___.
- Clarify that the goal is one person type in one moment of pain, not a full market segmentation exercise.
- Mention that focus speeds up design and prompting later.

On-screen / screen-share

- Fill in the sentence live using one example.
- Show a weak audience statement and then tighten it.

Watchouts

- Do not leave them with vague categories like founders, creators, or students.

Suggested close

"Once the user is clear, almost every other decision gets easier. Ambiguity starts to collapse."

PAUSE AND DO THE REP

Your job now: Choose one user and complete the sentence: "This app is for..."

Timebox: 10 minutes

Come back with: One clearly defined user statement.

1.3 - Define the Outcome

Length	5–6 min
Purpose	Move them from tool language to result language.
What the student should leave with	One clear user-facing outcome statement.

Suggested opening lines

"People do not really want software. They want a changed state. This lesson is about defining that changed state clearly."

Beats to cover

- Explain the difference between features and outcomes.
- Ask what gets easier, faster, clearer, safer, or less painful for the user.
- Show how outcome language sharpens the product promise and helps design later.
- Keep it simple: one sentence, user-facing, plain English.

On-screen / screen-share

- Rewrite a feature-heavy sentence into an outcome sentence.

Watchouts

- Do not let them write internal build language as the outcome.

Suggested close

"Good. We now know who this is for and what better feels like for them. That is enough to keep moving."

PAUSE AND DO THE REP

Your job now: Write one sentence that describes the outcome your app delivers.

Timebox: 5 minutes

Come back with: One clear user-facing outcome statement.

1.4 - Light Research, Not a Thesis

Length	8–10 min
Purpose	Teach practical research without dropping them into a rabbit hole.
What the student should leave with	3 quick research notes.

Suggested opening lines

"We are not writing a market report here. We are doing just enough research to understand what already exists and what people already expect."

Beats to cover

- Tell them where to look quickly: competitors, App Store, search, Reddit, forums, YouTube demos, landing pages.
- Explain what to capture: patterns, complaints, expectations, pricing, and messaging.
- Stress speed: this should inform the sprint, not consume it.
- Tell them to borrow structures that already make sense to users.

On-screen / screen-share

- Do a quick search and pull 2–3 references into a notes page or Figma frame.
- Show a mini compare list: what they do well / what they do poorly / what matters.

Watchouts

- Do not send them into TAM/SAM/SOM land in the core sprint.
- Do not make them think research must be exhaustive to be useful.

Suggested close

"That is enough. You are not trying to know everything. You are trying to avoid building blind."

PAUSE AND DO THE REP

Your job now: Find 2–3 existing solutions and jot down what they do well, what they do poorly, and what users seem to care about.

Timebox: 20 minutes

Come back with: 3 quick research notes.

1.5 - Map the Core Flow

Length	7–9 min
Purpose	Translate the app into a simple sequence of steps.
What the student should leave with	A simple flow map.

Suggested opening lines

"If you cannot explain the app in a simple flow, you are not ready to build it. So we are going to draw the core journey now."

Beats to cover

- Explain beginning, middle, and end.
- Tell them to use only words and arrows at first.
- Keep the flow to about five to seven steps.
- Anchor on the critical moment where the product actually delivers value.

On-screen / screen-share

- Draw a simple flow map live on paper or digitally.
- Clean up one messy example into a tighter five-step version.

Watchouts

- Do not let the map become UI-level too early.
- Do not allow a fifteen-feature spaghetti flow.

Suggested close

"Now the app has a spine. That spine is what design and build are going to follow."

PAUSE AND DO THE REP

Your job now: Draw the core user flow in 5 to 7 steps using only words and arrows.

Timebox: 10 minutes

Come back with: A simple flow map.

1.6 - Kill Scope

Length	6–8 min

Purpose	Force the student to cut before they get punished later.
What the student should leave with	A tighter MVP.

Suggested opening lines

"This is where most people lose the weekend. They keep too much. So we are going to cut hard right now."

Beats to cover

- Explain must-have versus nice-to-have.
- Ask what absolutely must work by Sunday for the promise to be true.
- Make them define version one boundaries.
- Give them permission to leave good ideas for version two.

On-screen / screen-share

- Show an in-scope / out-of-scope list and cross out several features live.

Watchouts

- Do not let "it would be nice if..." survive unchallenged.

Suggested close

"Good. The app is smaller now, which means the app is real now."

PAUSE AND DO THE REP

Your job now: Fill out the MVP scope section and cut at least 3 things.

Timebox: 10 minutes

Come back with: A tighter MVP.

1.7 - CEO Block Wrap-Up

Length	3–5 min
Purpose	Finalize the brief and make sure the student is ready to move on.
What the student should leave with	Your finished one-page product brief.

Suggested opening lines

"Before we enter design, I want the brief finished and clean enough that somebody else could understand the app in under a minute."

Beats to cover

- Recap the brief sections.
- Remind them that clarity here saves pain later.
- Tell them not to proceed with placeholders and half-decisions.

On-screen / screen-share

- Show a completed example brief and point to what makes it usable.

Watchouts

- Do not let this feel optional. The brief is a gate.

Suggested close

"Finish the brief. Then we will make the product concrete enough to build."

PAUSE AND DO THE REP

Your job now: Complete Worksheet 01 fully.

Timebox: 15 minutes

Come back with: Your finished one-page product brief.

The Design Block

Flow. Screens. Direction.

Block goal	Turn the idea into something concrete enough to build by gathering references, sketching, storyboarding, and making rough screens.
Final artifact	Worksheet 02 - Build-Ready Design Spec.
Recording mindset	Keep the pace moving. Explain only what helps the student make the artifact.

2.1 - Find References First

Length	6–8 min
Purpose	Get them to look before inventing.
What the student should leave with	A mini inspiration board.

Suggested opening lines

"Do not design from a blank brain. We are going to steal structure from the world instead of pretending we need to invent every pattern from zero."

Beats to cover

- Name your go-to sources like Mobbin, Spotted in Prod, and other libraries you actually use.
- Explain that they are collecting patterns, not copying identity.
- Tell them to look for flows, onboarding, layouts, and content hierarchy.
- Keep the scope tight: three to five references is enough.

On-screen / screen-share

- Open your favorite inspiration sites and drag a few screenshots into a Figma page.
- Cluster references by flow or style direction.

Watchouts

- Do not let them gather thirty screenshots and call that progress.

Suggested close

"The point is not to become a curator. The point is to stop designing in a vacuum."

PAUSE AND DO THE REP

Your job now: Gather 3–5 references that are close to your desired flow or visual direction.

Timebox: 10 minutes

Come back with: A mini inspiration board.

2.2 - Sketch Before Software

Length	7–9 min
Purpose	Use paper to remove ambiguity quickly.
What the student should leave with	Rough sketches of the main screens.

Suggested opening lines

"Paper is still one of the fastest design tools you have. We are going to use it to get the idea out of your head and onto the page before software gets involved."

Beats to cover

- Explain why sketching beats vague prompting.
- Show low-fidelity boxes, labels, arrows, and rough content areas.
- Mention the six-up sketch method if they are stuck.
- Reassure them that ugly sketches are fine.

On-screen / screen-share

- Overhead shot or document cam of a rough sketch.
- Translate one step of the flow into two or three boxes on paper.

Watchouts

- Do not slip into polished drawing. This should feel fast and rough.

Suggested close

"You are not making art. You are making the app easier to understand."

PAUSE AND DO THE REP

Your job now: Draw the core screens of your app on paper.

Timebox: 15 minutes

Come back with: Rough sketches of the main screens.

2.3 - Storyboard the Journey

Length	6–8 min
Purpose	Sequence the experience screen by screen.
What the student should leave with	A storyboard of the experience.

Suggested opening lines

"Now we are going to stop thinking about isolated screens and start thinking about the product as a journey."

Beats to cover

- Explain first touchpoint, main interaction, completion moment.
- Show how storyboarding prevents confusion later.
- Encourage them to think about the order that the user encounters the app.

On-screen / screen-share

- Lay out a simple storyboard in Figma or on paper.
- Walk from discovery to use to outcome.

Watchouts

- Do not let them obsess over rare edge cases yet.

Suggested close

"Good. The product is starting to behave like a sequence instead of a cloud of ideas."

PAUSE AND DO THE REP

Your job now: Lay out your user journey screen by screen.

Timebox: 15 minutes

Come back with: A storyboard of the experience.

2.4 - Figma Basics for Speed

Length	8–10 min
Purpose	Give them just enough Figma to move quickly.
What the student should leave with	Comfort moving around the file.

Suggested opening lines

"This is not Figma school. This is enough Figma to get through the sprint without feeling clumsy."

Beats to cover

- Show the core movements they actually need.
- Call out hotkeys explicitly and have them practice them.
- Encourage repetition over understanding every menu.

On-screen / screen-share

- Practice V, shift + arrow keys, command C, command V, command D, command R, and any other essentials you want to standardize.
- Show frames, moving, duplicating, aligning, and resizing.

Watchouts

- Do not wander into advanced Figma features.

Suggested close

"That is enough to move. Open the file, do the reps, and make the tool feel less foreign."

PAUSE AND DO THE REP

Your job now: Open the provided Figma file and practice the core hotkeys until they stop feeling weird.

Timebox: 5 minutes

Come back with: Comfort moving around the file.

2.5 - Turn Sketches Into Rough Screens

Length	10–12 min
Purpose	Move the product into rough digital frames.
What the student should leave with	3–5 rough screens.

Suggested opening lines

"Now we translate the paper into rough screens. Not beautiful. Not final. Just clear enough to build from."

Beats to cover

- Show how to turn rough boxes into rough frames.
- Keep hierarchy, flow, and content clarity ahead of polish.
- Add simple notes where the build will need context.

On-screen / screen-share

- Recreate one or two sketches in Figma live.
- Show a rough main screen, secondary screen, and transition.

Watchouts

- Do not get trapped in pixel-perfect spacing at this stage.

Suggested close

"If the structure is visible, we are winning. Pretty comes later."

PAUSE AND DO THE REP

Your job now: Create rough versions of your main screens in Figma.

Timebox: 20 minutes

Come back with: 3–5 rough screens.

2.6 - Choose a Visual Direction

Length	5–7 min
Purpose	Pick enough style direction to guide the build without opening a branding rabbit hole.
What the student should leave with	A simple visual direction.

Suggested opening lines

"You do not need a full brand system today. You need a clear enough visual direction that the app stops feeling generic."

Beats to cover

- Explain type choice, spacing feel, contrast, and one or two interface rules.
- Show that consistency beats complexity.
- Tie the visual direction back to the references they already collected.

On-screen / screen-share

- Compare two quick directions and choose one.
- Call out three style rules you want them to write down.

Watchouts

- Do not drift into deep branding theory in the core sprint.

Suggested close

"Perfect. We are not making a style guide. We are giving the build phase a clear taste signal."

PAUSE AND DO THE REP

Your job now: Choose your visual direction and write 3 style rules for the product.

Timebox: 10 minutes

Come back with: A simple visual direction.

2.7 - Design Block Wrap-Up

Length	3–5 min
Purpose	Lock the spec and make sure the build phase has usable inputs.
What the student should leave with	Your finished build-ready design spec.

Suggested opening lines

"Before we build, I want the product to feel obvious. If the app still feels foggy, the build will get weird fast."

Beats to cover

- Recap references, storyboard, screens, and style rules.
- Tell them what "build-ready" means.

On-screen / screen-share

- Show a finished build-ready design spec page.

Watchouts

- Do not allow them to leave design with only inspiration and no screens.

Suggested close

"Finish the spec. Then we will turn clarity into a working app."

PAUSE AND DO THE REP

Your job now: Complete Worksheet 02 fully.

Timebox: 15 minutes

Come back with: Your finished build-ready design spec.

The Build Block

Stack. Agent. Product.

Block goal	Translate the brief and design spec into a working local app using one default path, a strong agent brief, and ruthless focus on the core flow.
Final artifact	Worksheet 03 - Build Plan + Agent Brief + working local app.
Recording mindset	Keep the pace moving. Explain only what helps the student make the artifact.

3.1 - Build From the Brief

Length	5–7 min
Purpose	Stop students from prompting from vibes.
What the student should leave with	A completed agent brief.

Suggested opening lines

"Most AI builds fail because the thinking is muddy before the model ever starts writing code. So we are going to build from the brief, not from vibes."

Beats to cover

- Explain why clarity upstream matters more than clever prompting.
- Show a weak prompt versus a structured brief-driven prompt.
- Tie product clarity directly to implementation quality.

On-screen / screen-share

- Paste a weak prompt and compare it to a well-structured brief.
- Highlight the fields the model actually needs to know.

Watchouts

- Do not make prompting sound magical or mystical.

Suggested close

"If the brief is clear, the model has a chance. If the brief is muddy, the build gets muddy too."

PAUSE AND DO THE REP

Your job now: Copy your product brief and design spec into the agent brief template.

Timebox: 10 minutes

Come back with: A completed agent brief.

3.2 - Set Up the Environment

Length	8–10 min
Purpose	Get the starter project running locally without ecosystem chaos.
What the student should leave with	A working local environment.

Suggested opening lines

"We are choosing one path and moving. Not shopping for tools. Not debating the stack. Just getting the app running locally so you can build."

Beats to cover

- Name the default path you want them to use.
- Show the starter repo, local run, and file structure at a high level.
- Tell them what not to worry about yet.

On-screen / screen-share

- Open the repo, install, run the app, and show it in the browser.
- Point to the minimal files they should understand.

Watchouts

- Do not turn this into a tools roundup.
- Do not talk about every possible provider option.

Suggested close

"The goal here is not mastery. The goal is a working local environment."

PAUSE AND DO THE REP

Your job now: Open the starter project and get it running locally in your browser.

Timebox: 15 minutes

Come back with: A working local environment.

3.3 - Brief the Agent Correctly

Length	8–10 min
Purpose	Teach them how to give the model sequence, constraints, and definition of done.
What the student should leave with	Your first implemented screen.

Suggested opening lines

"Do not ask the model to be creative. Ask it to be accurate. This is where you give it the rails it needs."

Beats to cover

- Show how to specify the user, problem, core flow, screen order, and version-one boundaries.
- Tell them to request one screen or one step at a time.
- Show how to define what “done” means for the first slice.

On-screen / screen-share

- Paste the brief and ask for only the first screen or first step.
- Correct the model once so they see how to steer it.

Watchouts

- Do not let them ask the model to build the whole product in one shot.

Suggested close

“Good. The model has a lane now. Let’s make it earn its keep one slice at a time.”

PAUSE AND DO THE REP

Your job now: Paste in your brief and ask the agent to implement only the first screen or first step of the flow.

Timebox: 15 minutes

Come back with: Your first implemented screen.

3.4 - Build the Core Flow

Length	12–15 min
Purpose	Get them to implement the main product spine before they chase extras.
What the student should leave with	The core product flow working locally.

Suggested opening lines

“We are building the spine first. One screen at a time. One user path at a time. That is how you keep this weekend under control.”

Beats to cover

- Show the implementation order from entry to outcome.
- Stress that edge cases are second priority until the core flow works.
- Encourage a visible test after each major screen or step.

On-screen / screen-share

- Build through the main path live and show the app updating locally.
- Narrate what you are prioritizing and what you are ignoring.

Watchouts

- Do not let them blur together build and polish.

Suggested close

“If the main path works from start to finish, you are winning even if it still looks rough.”

PAUSE AND DO THE REP

Your job now: Implement the main user flow end to end.
Timebox: 30–45 minutes
Come back with: The core product flow working locally.

3.5 - Debug Without Spiraling

Length	8–10 min
Purpose	Help them fix blocker bugs without losing the weekend to cleanup mania.
What the student should leave with	An app that works locally from start to finish.

Suggested opening lines

"Something will break. That is normal. What matters is whether you fix the blockers or disappear into a bug spiral."

Beats to cover

- Distinguish blocker bugs from cosmetic bugs.
- Show a simple isolate-test-fix loop.
- Explain how to ask the agent to fix specific issues instead of vague brokenness.
- Tell them to stop when the core promise works.

On-screen / screen-share

- Use one or two realistic breakages and fix them live.
- Show how to describe the bug clearly to the agent.

Watchouts

- Do not let them think every issue must be fixed before ship.

Suggested close

"The app does not need to be flawless. It needs to deliver the core promise without breaking."

PAUSE AND DO THE REP

Your job now: Fix the 1–3 issues blocking your core flow.
Timebox: 20 minutes
Come back with: An app that works locally from start to finish.

3.6 - Build Block Wrap-Up

Length	3–5 min
Purpose	Lock the milestone and prepare for ship.
What the student should leave with	A working local app and completed agent brief.

Suggested opening lines

"Before we ship, I want one thing to be true: the product works locally and the core flow is intact."

Beats to cover

- Recap what counts as done for this block.
- Name the remaining types of issues that can wait until after ship.

On-screen / screen-share

- Show a local app completing the main flow end to end.

Watchouts

- Do not let this wrap-up become a feature brainstorm.

Suggested close

"Good. The product is alive. Now we are going to get it out of your machine and into the world."

PAUSE AND DO THE REP

Your job now: Complete Worksheet 03 fully.

Timebox: 10 minutes

Come back with: A working local app and completed agent brief.

The Ship Block

Deploy. Share. Launch.

Block goal	Deploy the app, package it, send it to real people, and capture the first round of useful feedback.
Final artifact	Worksheet 04 - Launch Plan + Feedback Tracker + live deployed app.
Recording mindset	Keep the pace moving. Explain only what helps the student make the artifact.

4.1 - Ship the Core, Not the Fantasy

Length	5–6 min
Purpose	Prepare them mentally to ship imperfect work.
What the student should leave with	Your ship checklist.

Suggested opening lines

"Most projects die here because people start comparing the real version on their screen to the fantasy version in their head. We are shipping the core, not the fantasy."

Beats to cover

- Reinforce that launch is part of the sprint, not a separate someday event.
- Have them define what absolutely must work before ship.
- Normalize imperfection without normalizing brokenness.

On-screen / screen-share

- Show a short ship checklist and an example of what can wait.

Watchouts

- Do not accidentally glorify sloppy work. Core must still work.

Suggested close

"Ugly and live beats elegant and trapped on your laptop. Let's get specific about what has to work."

PAUSE AND DO THE REP

Your job now: Write down what must work before this app is allowed to ship.

Timebox: 5 minutes

Come back with: Your ship checklist.

4.2 - Deploy the App

Length	8–10 min
Purpose	Get them to a live URL fast.
What the student should leave with	Your live URL.

Suggested opening lines

"The goal of this lesson is not infrastructure mastery. The goal is a live URL."

Beats to cover

- Show the simplest deployment path.
- Call out only the environment variables and checks that truly matter.
- Tell them to test the main flow after deploy.

On-screen / screen-share

- Deploy live and open the live site.
- Run one quick post-deploy test.

Watchouts

- Do not drift into advanced deployment theory.

Suggested close

"Perfect. The app is not hypothetical anymore. It has a URL."

PAUSE AND DO THE REP

Your job now: Deploy the app and get a live link.

Timebox: 20 minutes

Come back with: Your live URL.

4.3 - Record a Simple Demo

Length	5–7 min
Purpose	Make the app easier to share and easier to understand.
What the student should leave with	One demo clip.

Suggested opening lines

"A short demo lowers friction. It helps people understand the product quickly, and it forces you to explain the core value clearly."

Beats to cover

- Keep the demo to 30–60 seconds.
- Show entry, action, outcome.
- Tell them not to narrate the entire build story.

On-screen / screen-share

• Record one quick walkthrough live with a simple script.

Watchouts

• Do not let them overproduce this. It is a utility asset, not a trailer.

Suggested close

"Good. You now have a fast way to show what the app does without making people guess."

PAUSE AND DO THE REP

Your job now: Record a 30–60 second walkthrough of the core flow.

Timebox: 10 minutes

Come back with: One demo clip.

4.4 - Send It to Real Humans

Length	6–8 min
Purpose	Break the fear barrier and get first feedback into motion.
What the student should leave with	5 sends complete.

Suggested opening lines

"Now we do the thing most people avoid: we send it to real humans before we feel completely ready."

Beats to cover

• Define what a good first user is for this stage.
• Recommend a small list: 5 people, not 50.
• Give them a simple outreach script and the right feedback questions.

On-screen / screen-share

• Show your example outreach message.
• Show the 2–3 feedback questions you want them to ask.

Watchouts

• Do not let them ask useless questions like "Do you like it?"

Suggested close

"Send it before you overthink it. Momentum matters more than elegance here."

PAUSE AND DO THE REP

Your job now: Send the app to 5 people using the provided script.

Timebox: 15 minutes

Come back with: 5 sends complete.

4.5 - Capture Feedback and Plan Version Two

Length	6–8 min
Purpose	Turn launch into momentum instead of a one-off event.
What the student should leave with	A next-steps list.

Suggested opening lines

"The sprint ends with version one live. It does not end with the product finished forever. So now we choose what matters next."

Beats to cover

- Explain how to log feedback cleanly.
- Separate confusion, compliments, bugs, and feature requests.
- Choose the top three improvements for version two.

On-screen / screen-share

- Show a simple feedback tracker and how you would rank what comes next.

Watchouts

- Do not let them react to every piece of feedback equally.

Suggested close

"This is how one weekend turns into a real build loop instead of a one-time burst."

PAUSE AND DO THE REP

Your job now: Log the first feedback you get and choose the top 3 improvements for version two.

Timebox: 15 minutes

Come back with: A next-steps list.

4.6 - Final Wrap

Length	3–5 min
Purpose	Close the rep and reinforce the identity shift.
What the student should leave with	A short reflection and next-step list.

Suggested opening lines

"Take a second and actually notice what you just did. Most people never make it from idea to shipped product. You just completed a full rep."

Beats to cover

- Recap the four artifacts and what they now know how to do.
- Tell them the goal was never total mastery; it was becoming someone who ships.
- Encourage version two, but only after they acknowledge the win.

On-screen / screen-share

- Show the finished checklist: brief, spec, local app, live URL, first send.

Watchouts

- Do not underplay the achievement by rushing straight into next steps.

Suggested close

"You do not need to know everything to become dangerous. You now have the rep. That changes how you build from here."

PAUSE AND DO THE REP

Your job now: Review your four worksheets and note the top 3 things you want to improve in the next recording or next product.

Timebox: 10 minutes

Come back with: A short reflection and next-step list.

Appendix - fast recording checklist

- Open with why this lesson matters in practical terms.
- Show one good example before asking the student to do the rep.
- Keep the screen share moving. Avoid idle clicking and searching.
- Use the same pause language every time so the rhythm becomes familiar.
- End each lesson with one visible next action, not a vague summary.
- If a lesson starts getting philosophical, cut it and get back to the artifact.
- When in doubt, simplify the step and shorten the explanation.

Suggested repeated language

“Pause this now and go do it.”

“Come back when you have something on the page.”

“Do not try to make it perfect. Just make it real.”

“We are building the spine first.”

“Live beats stuck. Shared beats hidden. Finished beats almost.”
